GIMA

LARYNGEAL MASK DEVICE

Peel To Open

Sterile • Disposable • Contents Sterile if Unopened, Undamaged • Do not expose to temperatures above 120°F (49°C)
Contains: 1 Laryngeal Mask Airway

- Deflate cuff before intubation.
- The index finger is placed at the junction of the cuff and the tube.
- With the head extended and the neck flexed, carefully flatten the laryngeal mask airway tip against the hard palate.
- To facilitate laryngeal mask airway introduction into the oral cavity, gently press the middle finger down on the jaw.
- Using the index finger, advance the laryngeal mask airway while following the contours of the hard and soft palates.
- Maintain pressure with the finger on the airway tube and advance the laryngeal mask airway until definite resistance is felt at the base of the hypopharynx. Note the flexion of the wrist.
- Inflate the cuff with enough air to obtain an airway at 18-20 cm H_2O. Do not exceed the maximum volume recommended for the cuff.
- Finally, secure the tube, suggest inserting a bite block and attach the tube to the ventilation equipment.
- **Caution:** Gently maintain cranial pressure with the non-dominant hand while removing the index finger. Inflation without holding the tube allows the mask to seal itself optimally. Reconfirm mask position after any change in the patient's head or neck position.
- **Warning:** Check for clear airflow passage prior to use. Do not use in the presence of lasers and electrocautery equipment, as it may be flammable. The laryngeal mask airway does not protect the patient from the effects of regurgitation and aspiration.

PVC

Internal Volume: 5ml
Pressure Drop: 2cm H_2O
Minimum Interdental Gap: 20mm

< 5 kg (11 lbs)

<4 mL/60 cm H_2O
